

Graph Theory Tools for Tournament Scheduling

Dalibor Froncek, University of Minnesota Duluth, Duluth, MN – 55812

Abstract

We introduce several ways of measuring the fairness of round-robin and incomplete tournaments. These include balanced home-away patterns, carry-over effects, total strength of opponents, or multi-year rotation of opponents. – Then we present some graph theory tools that can be used to schedule tournaments that are optimized with respect to some of the above criteria.

Keywords: round-robin tournaments, incomplete tournaments, tournament scheduling.
