## Logical Language

- Logical language - differs from 'spoken/understood' language.
  - o If it rains, I will drive to work.
    - What will happen if it doesn't rain? Cannot determine. Only known what happens if statement is 'true' (rains).
  - o I will go to the movies or the party.
    - Does not exclude the possibility of both. Normal connotations would suggest it is either/or.
  - o He is nice.
    - Isn't specific. He cannot be known until defined. It is not a declarative statement

Statement is a declarative sentence. It is true or false.

Ex:

The radius of the earth is 20,000 meters.

- Is declarative because it is either true or false without necessarily knowing which...

Ex (NOT a statement):

If  $X^2$ , then  $X=3$ .

- If  $X \in \{\text{integers}\}$ , then the statement is false since  $X=-3$  could be the case.
- If  $X \in \{\text{positive integers}\}$ , then statement is TRUE.
- We cannot establish that the sentence is TRUE or FALSE.

***We must know the "universe"/ constraints.***

Do your Homework!

- Neither TRUE or FALSE

Did you do your homework?

- (Question - not declarative)

## Statement

Statements can be:

"10 is an even number."

"9 is an even number."

Can be represented mathematically...

P = "10 is an even number."

Q = "9 is an even number."

P and Q: "10 is an even number."  
"9 is an even number."

P and Q =  $P \wedge Q$

P or Q =  $P \vee Q$

P or Q = PvQ

"Not" P =  $\sim$ P    ->    "It is not the case that 10 is an even number."  
"10 is not an even number."

P - "I am going to the party."

Q - "I am going to the movies."

PvQ - "I am going to the party or the movies."

*\*includes the possibility of both*

What is  $\sim$ (PvQ)?

"I am not going to the movies or the party." ?

- Can be difficult to understand

Do NOT need to understand the statement to determine TRUE or FALSE.

- Use Truth Table.

P	Q	PvQ	$\sim$ (PvQ)
True	True	True	False
True	False	True	False
False	True	True	False
False	False	False	True

We can also understand  $\sim$ (PvQ) as equal to  $(\sim$ P)  $\wedge$  ( $\sim$ Q) (IE: Not P and Not Q).

*\*This is universally true and will be proven later*
